Overview

What is a supercapacitor energy storage system?

A 400kW, 1.0kWh supercapacitor energy storage system that aims at improving the power quality in the electrical grid, both in steady state (e.g., harmonic compensation) and during transients (e.g., fault-ride through). A 100kW, 200kWh battery energy storage system, that is based on distributed MMC architecture.

Why do we need energy storage systems?

and the electrification of transportation and heating systems. As a consequence, the electrical grid sees much higher power variability than in the past, challenging its frequency and voltage regulation. Energy storage systems will be fundamental for ensuring the energy supply and the voltage power quality to customers.

Why do energy storage systems need a DC connection?

DC connection The majority of energy storage systems are based on DC systems (e.g., batteries, supercapacitors, fuel cells). For this reason, connecting in parallel at DC level more storage technologies allows to save an AC/DC conversion stage, and thus improve the system efficiency and reduce costs.

How does a multi-stage energy storage system work?

Multi-stage solutions In the conventional approach, which involves a single power conversion stage, the energy storage system is connected directly to the DC link of the converter (Fig. 4c). Increasing its working voltage requires larger serially-connected cell strings, leading to reductions in system-level reliability.
