

# **20MWh Energy Storage Container for Agricultural Irrigation in Central Asia**

## Overview

---

Central Asia has faced major energy and water security challenges. Technically, water from the Pamir and Tian Shan Mountain ranges could be sufficient to meet the needs of the countries in the region, if there.

Is micro-hydropower possible in Central Asia?

Central Asian countries are highly interdependent in terms of water and energy. Small- and micro-hydropower potential in Central Asia is insufficiently utilized. Micro-scale hydropower can be embedded into irrigation network with energy storage. Levelised cost of energy below 0.03 EUR/kWh is achievable for micro-hydropower.

How can we improve water and energy in Central Asia?

One of the most effective solutions would be to create an International Water and Energy Consortium for Central Asia (IWECA). This consortium would focus on irrigation and energy projects and facilitate interaction between multilateral development banks (MDBs) and their dialogue with the region's countries. 2.

Can energy storage solve transboundary water and energy conflict in Central Asia?

A solution for transboundary water and energy conflict in Central Asia is proposed. Benefits of energy storage beyond the energy sector are shown. Long duration energy storage is key for high shares of solar PV and wind energy in the region. An open-access, integrated water and energy system model of Central Asia is developed.

What is the solution to the water deficit in Central Asia?

Source: EDB estimates based on data from statistics agencies. The primary solution to the water deficit lies in improving irrigation practices. Agriculture in Central Asia is the largest consumer of water, with irrigation accounting for 100.4 km<sup>3</sup> of the total 127.3 km<sup>3</sup> (80%) of water used in the region in 2020.
