What is a small cell in 5G?

Small cells are a new part of the 5G platform that increase network capacity and speed, while also having a lower deployment cost than macrocells. The compact size of a small cell requires that all components – especially power converters – provide high efficiency, better thermals and eventually the best power density possible.

How do small cells fit into the 5G ecosystem?

A cell tower (also called a macrocell) is a huge umbrella used to provide radio signals to thousands of users in large areas with minimal obstructions. To extend the coverage of a macrocell, distributive antenna systems (DASs) are used in conjunction with the cell tower.

What is 5G & why is it important?

5G can help realize the future of Internet of Things (IoT), connected cars and smart cities through higher speeds (up to 10 Gbps), better coverage (capacity expansion by a factor of 1,000) and improved reliability (by leveraging ultra-wide bandwidth and throughput).

What is the trend in 5G radio applications?

The trend in 5G radio applications is to use higher frequencies and shorter wavelengths. Increasing the frequency increases the speed of sending/receiving signals and helps shrink the size of the antenna, which in turn shrinks the size of the cell.
