

A set of solar panel inverters

Overview

What is a solar inverter?

Solar inverters are the heart of any solar energy system, converting the direct current (DC) electricity generated by solar panels into alternating current (AC) power for homes, businesses, or utility grids.

What is a central inverter?

Central inverters are a larger version of string inverters, designed to handle more strings of solar panels, making them ideal for sizable solar installations. In these systems, instead of having multiple strings connected directly to the inverter, the strings are first combined in a combiner box.

How do solar inverters work?

In a large-scale utility plant or mid-scale community solar project, every solar panel might be attached to a single central inverter. String inverters connect a set of panels—a string—to one inverter. That inverter converts the power produced by the entire string to AC.

What are the different types of solar inverters?

When it comes to home solar installation, homeowners have three types of solar inverters to consider: string inverters, string inverters with DC power optimizers and microinverters. Each inverter setup comes with upsides and downsides. Here's what you should know.
