Overview

How to analyze electrochemical impedance spectral data of vanadium redox flow battery?

The electrochemical impedance spectral data of vanadium redox flow battery is analyzed, using equivalent circuit modeling and Multiphysics modeling to understand cell component properties and improve performance. 1. Introduction.

What are the equivalent circuit parameters of a multiphysics model?

(c) Porosity. (d) D_m and D_m for diffusion coefficients. Figure lines are the equivalent circuit model fits of the results obtained from the Multiphysics model which are in markers. The equivalent circuit parameters R_{el} , R_{ct} , R_0 , C_{dl} , q' , and n for the membrane parameter results are presented in Table 3. Table 3.

When is BCPE impedance reduced to CPE?

BCPE impedance is reduced to that of a CPE when the \tanh term tends to unity (i.e. infinite thickness), or with frequency ω (Hz) $\rightarrow \infty$. where q and q' are in s^{-n}/Ω . Series/ohmic resistance (R_{el}), charge transfer or polarization resistance (R_{ct}), and BCPE structural resistance (R_0) are in Ω .
