

# Are base stations divided into indoor and outdoor

## Overview

---

What is a base station?

It is a fixed location equipped with antennas and other equipment that receives and transmits radio signals to and from mobile devices, such as smartphones, tablets, and other wireless devices. Base stations are an essential component of cellular networks, providing coverage and connectivity to mobile devices within a specific area or cell.

What is an indoor base station?

Indoor base stations in rack format This is the most common type of base station, in which all its components are integrated in a rack-type cabinet, which provides more space for more modules or components. This can enable, for example, redundancy of all components, thereby improving system availability.

How do base stations work?

Base stations use antennas mounted on cell towers to send and receive radio signals to and from mobile devices within their coverage area. This communication enables users to make voice calls, send texts, and access data services, connecting them to the wider world. Network Management and Optimization.

What are the different types of base stations?

Some basic types of base stations are as follows: Macro-base stations are tall towers ranging from 50 to 200 feet in height, placed at strategic locations to provide maximum coverage in a given area. Those are equipped with large towers and antennas that transmit and receive radio signals from wireless devices.
