What is a battery management system (BMS)?

A Battery Management System (BMS) is a crucial component in any rechargeable battery system. Its primary function is to ensure that the battery operates within safe parameters, optimizes performance, and prolongs its lifespan. A BMS achieves this by monitoring individual cell voltages, temperatures, charging/discharging cycles, and current flow.

What is a BMS used for?

A Battery Management System (BMS) is widely used in various applications such as electric vehicles (EVs), energy storage systems (ESS), uninterruptible power supplies (UPS), and industrial battery applications.

What is BMS supplementary installation?

The battery pack is designed with BMS supplementary installation to ensure its highest safety. Battery designers prefer to apply more 'external measures' to stop battery fire. However, BMS is dedicated to measuring the current, voltage, and temperature of the battery pack; BMS serves no purpose if BMS hazards are caused by other issues.

What is a battery balancing system (BMS)?

One of the key functions of a BMS is cell balancing, which ensures that each cell in a battery pack is charged and discharged uniformly. Cells in series often exhibit slight differences in capacity, causing certain cells to overcharge or undercharge.
