

Energy storage power station battery discharge depth

Overview

What is depth of discharge (DOD)?

Depth of Discharge (DOD) refers to the percentage of a battery's capacity that has been used during a discharge cycle. Simply put, it measures how much of the battery's stored energy has been consumed. For example, if a 10kWh battery discharges 5kWh, the DOD for that cycle is 50%.

How does deep discharge affect battery life?

Depth of Discharge (DOD) A battery's lifetime is highly dependent on the DOD. The DOD indicates the percentage of the battery that has been discharged relative to the battery's overall capacity. Deep discharge reduces the battery's cycle life, as shown in Fig. 1. Also, overcharging can cause unstable conditions.

What is the difference between depth of discharge and state of charge?

Depth of discharge (DoD) indicates the percentage of the battery that has been discharged relative to the overall capacity of the battery. State of charge (SoC) indicates the amount of battery capacity still stored and available for use. A battery's "cyclic life" is the number of charge/discharge cycles in its useful life.

Does deep discharge depth reduce battery aging costs?

Deep discharge depth increases BESS energy consumption, which can ensure immediate revenue, but accelerates battery aging and increases battery aging costs. The proposed BESS management system considers time-of-use tariffs, supply deviations, and demand variability to minimize the total cost while preventing battery aging.
