Overview

What is an Energy Management System (EMS)?

Energy management systems (EMSs) are required to utilize energy storage effectively and safely as a flexible grid asset that can provide multiple grid services. An EMS needs to be able to accommodate a variety of use cases and regulatory environments. 1. Introduction.

How do energy storage systems maximize revenue?

In these regions the potential revenue of ESSs is dependent on the market products they provide. Generally, the EMS tries to operate the ESS to maximize the services provided to the grid, while considering the optimal operation of the energy storage device. In market areas, maximizing grid services is typically aligned with maximizing revenue.

What are the components of a local EMS?

Just as an ESS includes many subsystems such as a storage device and a power conversion system (PCS), so too a local EMS has multiple components: a device management system (DMS), PCS control, and a communication system (see Figure 2). In this hierarchical architecture, operating data go from the bottom to the top while commands go top to bottom.

What is EMS & how does it work?

The objective of the EMS is to shift and shave the electricity usage of consumers by charging and discharging the ESS to minimize their bills . The savings often come from demand charge reduction, time-of-use (TOU) energy charge reduction, and utilization of net-metering energy.
