

Five-series and three-parallel solar container lithium battery pack

Overview

What if there are only two batteries in a parallel string?

If there are only two batteries in the parallel string, we would then take a cable from the POS. (+) terminal of Battery 1 to the charger. We would use the POS. (+) terminal of Battery 2 for connection to the loads.

Why are lithium batteries connected in series?

Lithium batteries are connected in series when the goal is to increase the nominal voltage rating of one individual lithium battery - by connecting it in series strings with at least one more of the same type and specification - to meet the nominal operating voltage of the system the batteries are being installed to support.

What happens if you connect two lithium batteries in series?

Two 12.8V-100AH lithium batteries connected in series becomes a 25.6V-100AH battery bank with 2560 watts of stored energy potential to 100% DOD. Connecting batteries in Series increases the battery bank voltage and total stored energy.

What if there are only two batteries in a series string?

If there are only two batteries in the series string (Figure 1), we would then take a cable from the open POS. (+) terminal of the first battery and a cable from the open NEG. (-) of the second (last) battery in the string to the load and charger/power source.
