

Grid-connected inverter can be connected to the battery

Overview

How does a grid tie inverter work?

When the sun is out, your solar panels keep your batteries charged and your essential loads are powered from your batteries. Once grid power is restored, your battery-based inverter shuts down and your grid tie inverter reconnects to the grid, powering your entire home as normal.

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.

How does a battery based inverter work?

The battery-based inverter is connected to an electrical sub-panel that contains circuits to all the loads you consider essential to use during a utility outage. When the battery-based inverter senses the grid is down, it shuts off power going to the grid automatically and begins to power your essential loads from your batteries.
