Overview

Do inverters need batteries?

For most residential and small commercial setups, the traditional battery and power inverter combo is the preferred choice to ensure continuous power supply during blackouts. So, while some inverter types do not require batteries, if your priority is uninterrupted backup power, investing in a quality battery in inverter system is essential.

What is an inverter battery?

An inverter battery is a specially designed energy storage solution that powers an inverter during electricity outages. Unlike automotive or starter batteries—which provide short bursts of high current to start engines—inverter batteries are built for deep-cycle performance, meaning they release a steady amount of energy over a longer duration.

How does a battery inverter work?

The battery sends DC power to the inverter, which then changes it to AC to power loads. This operation is more straightforward if you understand how an inverter works with battery storage. Let's trace the operation before and after or, put another way, during charging and when discharging.

What type of batteries are used in inverter systems?

The most commonly used batteries in inverter systems are tubular lead-acid batteries and flat plate lead-acid batteries, with lithium-ion batteries becoming more popular in recent years. Tubular batteries are preferred for their deep discharge capacity and long life, making them ideal for homes with frequent power cuts.
