## Overview

---

String inverter systems, on the other hand, connect multiple solar panels in series to a single, central inverter, forming a series circuit. A circuit of series-connected panels is called a “string”. What is a series solar inverter & how does it work?

Series connection is the most popular configuration for home grid-tie systems: cheap and offers good efficiency. When you connect solar panels in series, their voltages add up. The current is as low as a single panel in an array provides. Maximum power point technology in an inverter allows it to convert extra voltage to current.

How to connect two solar panels in series?

To do this wiring, make two sets (pairs) of PV panels and connect them in series. This way, you will have two pairs of solar panels connected in series. Now, connect the two sets of series connected solar panels in parallel as shown in the following fig. Now, you are having four 12V, 10A solar panels connected in series-parallel configuration.

How many solar panels are connected in a series?

A set of two solar panels connected in series Series Voltage:  $V_1 + V_2 + V_n$   
 $12V + 12V = 24V$ . (Voltage is additive in series connection) Series Current:  $I_1 = I_2 = I_n$   $10A = 10A = 10A$ . (Current is same in series connection). Now, we have two sets of series connected solar panels. If we connect these two set in parallel: Parallel Voltage:..

How do solar panels work in a series?

Wiring solar panels in a series means connecting the positive terminal of one solar panel to the negative terminal of the next, creating a chain-like circuit. This configuration increases the voltage of the rooftop solar panel system while keeping the current the same as a single solar panel.
