

Seaside wind power generation wind and solar energy storage

Overview

Can offshore wind turbines be used in the North Sea?

In the North Sea, the energy density that offshore wind turbines can accommodate in the North Sea is 2-4 MW/km², . Assuming the calculated capacity factor of 55% for offshore wind, at least 67-134 km² of marine space would be needed for additional wind turbines to produce the same yearly output as the multi-source park.

Are wind farms sustainable?

However, the average installed energy density of wind farms in the North Sea is approximately 7 MW/km² and thus most existing wind farms are generating electricity in an unsustainable manner . Therefore, continuing to build wind farms at current energy density results in the loss of offshore wind energy resources and ultimately loss of revenue.

What is the energy density of wind turbines in the North Sea?

On average, the extracted energy density in the multi-source scenario increases by 22%. In the North Sea, the energy density that offshore wind turbines can accommodate in the North Sea is 2-4 MW/km², .

What is a battery energy storage system (BESS)?

To overcome these challenges, battery energy storage systems (BESS) have become important means to complement wind and solar power generation and enhance the stability of the power system.
