Are rechargeable room-temperature sodium-sulfur (na-S) batteries suitable for large-scale energy storage?

Rechargeable room-temperature sodium-sulfur (Na-S) and sodium-selenium (Na-Se) batteries are gaining extensive attention for potential large-scale energy storage applications owing to their low cost and high theoretical energy density.

Are sodium-sulfur batteries a viable energy storage alternative?

Sodium-sulfur batteries have long offered high potential for grid-scale stationary energy storage, due to their low cost and high theoretical energy density of both sodium and sulfur. However, they have also been seen as an inferior alternative and their widespread use has been limited by low energy capacity and short life cycles.

Could a room-temperature sodium-sulfur battery reduce energy storage costs?

They say it is far cheaper to produce and offers the potential to dramatically reduce energy storage costs. An international research team has fabricated a room-temperature sodium-sulfur (Na-S) battery to provide a high-performing solution for large renewable energy storage systems.

What is a sodium-sulfur battery?

Sodium-sulfur (NaS) batteries are a promising energy storage technology for a number of applications, particularly those requiring high-power responses [11,21]. It is composed of a sodium-negative electrode, a sulfur cathode, and a beta-alumina solid electrolyte that produces sodium pentasulfide during the discharge reaction .
