## Overview

---

What should a supercapacitor charge current be?

The charging current should be within the safe operating range specified by the supercapacitor manufacturer. Exceeding the maximum charging current can lead to excessive heat generation, reduced lifespan, and potential damage to the supercapacitor. Similarly, the charging voltage should not exceed the rated voltage of the supercapacitor.

How do you charge a super capacitor?

Most super capacitors (supercaps) can be discharged down to 0 V and recharged to their maximum voltage with the manufacturer recommended charge current. A simple voltage regulating LED driver with constant current, usually regulated by sensing a low side, series current sense resistor, then a voltage clamp can be used to charge a super capacitor.

Can a supercapacitor charge more than rated voltage?

A common rule of thumb is to limit the charging current to the supercapacitor's rated current. The charging voltage should not exceed the supercapacitor's rated voltage, to prevent overvoltage damage. A voltage regulation circuit is necessary.

How do you charge a 200F supercapacitor?

During the docking time in between shuttle flights, it charges the 200F supercapacitor ensemble (C) at a voltage  $V = 5V$ , storing a charge:  $Q = C \times V = 200 \times 5 = 1000$  Coulomb With a 20A charging current, the supercapacitor will charge in time  $t = 50s$  ( $Q/I$ ).
