

# Tracking the maximum power of solar panels

## Overview

---

How to get maximum power out of a solar panel?

To get maximum power out of a solar panel, three aspects need to be considered: i. Irradiance: Modifies the present operational point of a PV panel. ii. Temperature: Adjusts the operating voltage point of PV panels. iii. Load: The load acts as a voltage and current reference.

How to track the maximum power of a PV panel?

Based on this observation, this article introduces a straightforward method for tracking the maximum power of a PV panel by using an optimizer, focusing solely on its temperature response as an input variable. The proposed approach hinges on linearizing the relationship between panel temperature and operating voltage.

Can solar panels be tracked by optimum voltage with temperature?

Finally, the current study shows that the tracking of the MPP of solar panels through direct estimation of the optimum voltage with temperature can offer performance that is comparable to that of tracking devices employing more complex algorithms.

Should solar power be tracked?

However, solar output is always expected to be close to maximum whenever it can be quickly tracked and brought close to it. This makes the integration of PV power generation into a reliable power network often uneconomical without a proper tracking scheme.
