

# UPS uninterruptible power supply output frequency is abnormal

## Overview

---

UPS without frequency tracking function will directly trigger "frequency abnormality protection," cut off the mains input, and switch to battery mode to prevent abnormal frequency power from being output to the load, thus avoiding equipment damage. What is an uninterruptible power supply (UPS) system?

Power distortions such as power interruptions, voltage sags and swells, voltage spikes, and voltage harmonics can cause severe impacts on sensitive loads in the electric systems. Uninterruptible power supply (UPS) systems are used to provide uninterrupted, reliable, and high-quality power for these sensitive loads.

What is a ups & how does it work?

1. Introduction UPS is the abbreviation for Uninterruptible Power Supply, and is a device which supplies power to devices for a fixed amount of time without stopping even when there are problems occurring with utility power and other power sources.

Why is my ups not working?

The UPS does not start operation. "Power" switch is turned ON. Make sure that the AC input is securely connected to commercial power. operation, there is a problem with the UPS. Refer to Interpreting beeps and displays in the user's manual. Backup is not possible. failure occurs. The battery may not be fully charged.

Why do we need uninterruptible power supplies?

However, during transmission and distribution, it is subject to voltage sags, spikes and outages that can disrupt computer operations, cause data loss and damage equipment. The uninterruptible power supplies protect the connected equipment from power problems and provide battery backup during power outages.
