

What is a solar grid-converting inverter

Overview

What is an on grid solar inverter?

An on grid solar inverter is a key component in solar power systems that are connected to the main power grid. Its primary function is to convert the direct current (DC) electricity generated by solar panels into alternating current (AC) electricity, which is compatible with the utility grid.

How does a grid connected solar inverter system work?

When the power generated by the system exceeds the load demand, the excess power can be delivered to the grid, realizing “net metering”. Conversely, when the system does not generate enough power to meet the load demand, the required power can be purchased from the grid. Grid-connected solar inverter system have many advantages, including:

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.

How does a solar inverter work?

Synchronization with Grid: The inverter synchronizes the frequency and phase of the AC power with the grid to ensure seamless integration. **Energy Export:** If the solar system generates excess electricity, it is exported to the grid, earning credits in systems like net metering.
